ABSTRACT

Method, system and terminal for setting, in an
information system having a network connecting user
terminals and one or more servers, local user preferences
valid for the terminal and non-local user preferences valid
5   for the servers. A preferences setting file is downloaded
from one of the servers to the relevant terminal, which is
completed by the terminal user with that user's local
and/or non-local preferences. Subsequently, the completed
preferences setting file is uploaded to that one server.
10   One or more preference groups ("moods") may be assigned to
the completed local and/or non-local preferences. The user
may select any one of the preference groups resulting in
retrieval by that one server of the local and/or non-local
preferences assigned to the selected preference group, and
15   activating the relevant preferences in the group in the
terminal, the network and/or that one server.
